About AI

Artificial Intelligence (AI) continues to reshape industries and societies worldwide. Despite its emergence in 1956 and the rapid spread of its technologies today, there is still no universally accepted definition of AI. This is largely due to the inherent complexity of defining human intelligence itself, along with the variety of perspectives that shape interpretations of artificial intelligence.

As the Kingdom of Saudi Arabia advances its digital transformation journey, AI technologies foster innovation, enhance productivity, and drive sustainable economic growth.

What is Artificial Intelligence?

While many theoretical definitions of AI focus on a machine's ability to replicate human behavior or perform tasks requiring intelligence, a more practical definition, reflecting today's widespread applications, is: **Systems that employ methods to gather data and use it to predict, recommend, or make decisions with varying degrees of autonomy, selecting the best course of action to achieve specific objectives.**

Why AI Matters

AI is a transformative technology that accelerates innovation, enhances productivity, and improves the quality of services across numerous sectors. It is pivotal in raising operational efficiency, expanding capabilities, and enabling smarter decision-making.

However, despite AI's rapid growth and widespread use, its true capabilities remain uncertain. In some cases, this has led to unrealistic expectations, making it challenging for decision-makers in both the public and private sectors to fully understand AI technologies and their practical applications.

AI Regulatory Landscape in Saudi Arabia

Principles and Controls of AI Ethics

With AI technologies advancing rapidly and being deployed across various fields, ensuring their responsible and ethical use is critical. Saudi Arabia emphasizes the application of ethical principles throughout the lifecycle of the development of the AI system.

The **Principles and Controls of AI Ethics** serve to:

- ☑ Guide research, development, and innovation initiatives within the Kingdom.
- ☑ Ensure responsible use of AI technologies.
- ☑ Enhance the quality and trustworthiness of AI-driven services provided to individuals.

Generative AI Guidelines

Recognizing the growing adoption of generative AI technologies, Saudi Arabia has developed two versions of the Generative AI Guidelines:

- ☑ **Generative AI Guideline for Government**: designed to assist government employees in responsibly adopting and using generative AI systems.
- ☑ **Generative AI Guideline for the Public**: aimed at individuals and organizations across society to ensure responsible and informed use of generative AI technologies.

Both guidelines provide practical recommendations and examples based on common scenarios, insight into challenges and considerations related to generative AI, and proposed principles for responsible use and best practices.

AI Adoption Framework

The [AI Adoption Framework provides](#) a comprehensive approach to guide the implementation of AI across all sectors. It outlines key steps, best practices, and strategic directions to help ensure the responsible and optimal use of AI technologies.

The framework aims to support public and private sector organizations in achieving their AI-related goals, promote consistency in AI adoption, and ensure AI initiatives align with national objectives and ethical standards.

AI for Humanity and the Global Community

Countries worldwide are rapidly integrating AI technologies as a core component of their national strategies to build robust, data-driven economies. The Kingdom of Saudi Arabia has established the [Saudi Data & AI Authority \(SDAIA\)](#) to solidify its position as a global leader in data and AI-driven sustainable economies.

Saudi Arabia was among the first nations to leverage AI and data technologies to support its ambitious Vision 2030 objectives. The Kingdom continues to lead regional and global efforts in responsible AI adoption through strategic investments and forward-looking policies.

Foresight: AI's Global Impact

- ☑ 58.8 Trillion SAR – Projected contribution of AI to the global economy by 2030.
- ☑ 412.5 Billion SAR – Projected global spending on AI by 2024.
- ☑ 97 Million – New jobs expected to be created by AI by 2025.
- ☑ 69% – Percentage of managers' daily tasks expected to be fully automated by 2024.

Leveraging generative AI capability to improve public services

Saudi Government entities are adopting generative AI, especially through large

language models (LLMs), to drive digital transformation and enhance public services.

By using tools such as ChatGPT, public sector entities respond more efficiently, reduce administrative burdens, and improve service quality across various sectors.

Examples of Government Portals and Platforms Using AI-Powered Chatbots

Many of Saudi Arabia's digital government services and platforms integrated generative AI to improve quality and deliver more efficiently, among them:

☑ [Quiwa](#)

The Quiwa platform has developed an intelligent detection tool based on artificial intelligence and large language models (LLMs) to analyze behaviors and identify unusual patterns among users. Using natural language processing (NLP) techniques, the tool accurately and instantly detects violations. It has enhanced monitoring efficiency by more than 40%, reduced reliance on manual verification, and accelerated decision-making. Moreover, it has enabled authorities to predict potential manipulation attempts before they occur. The solutions also include a fraud detection engine and advanced visual analytics tools.

The Quiwa platform launched also the “Smart Advisor” service to guide users and enhance their experience by providing instant, AI-powered consultations using large language models (LLMs). These models analyze inquiries and understand context to deliver accurate and relevant responses. The system has simplified access to information and reduced human guidance requests by 17%, while improving service quality and minimizing errors caused by misjudgment or unclear procedures. The advisor also leverages intelligent linking between user inquiries and their records, enabling personalized responses and effective guidance—representing a qualitative shift in delivering digital services through a smart and interactive approach.

☑ [Visit Saudi](#)

The Saudi Tourism Authority launched “Noura”, an intelligent virtual guide for visitors and tourists, leveraging artificial intelligence and large language models (LLMs) to deliver a personalized and interactive user experience. The platform provides instant responses to inquiries and offers tailored travel recommendations. It stands out for its ability to integrate and interpret diverse data sources to generate intelligent content that enriches the tourist experience, while delivering smooth, human-like interactions. Noura has contributed to higher visitor satisfaction, encouraged exploration of new destinations, and supported the development of integrated travel itineraries—representing a pioneering model of AI adoption in the tourism sector.

☑ [Etimad](#)

The Etimad platform successfully developed the AI assistant “EtimadGPT” by leveraging generative AI technologies to enable users to access financial systems, regulations, and government frameworks quickly and intelligently through an interactive conversational interface. This interface supports decision-making while saving time and effort. The platform utilizes advanced technologies, including a vector database, cloud computing, and a semantic search engine, which have collectively handled over 116,000 inquiries and saved more than 2,256 work hours, while reducing response times by over 70%. The platform has significantly improved user experience, enhanced financial workflow efficiency, and strengthened trust in government digital systems.

☑ [Sehhaty \(App\)](#)

The Sehhaty app successfully launched the “Digital Twin” project, a technological innovation that combines patient data with artificial intelligence to create a virtual model that helps predict diseases and support accurate health decision-making. This digital twin enables proactive monitoring of individuals’ health and is currently available to over 30 million users in the Kingdom. The initiative has contributed to improving preventive care quality, accelerating medical response, reducing treatment costs, and enhancing the economic efficiency of the healthcare sector. It also reflects Saudi Arabia’s leadership in adopting AI technologies in the regional healthcare landscape.

✓ [Musaned](#)

The Musaned platform has utilized artificial intelligence technologies to enhance service quality by supporting the selection of the most suitable domestic worker through machine learning techniques. In addition, it offers a chatbot service powered by AI to simulate human conversations, enabling users to receive instant responses and accurate consultations without human intervention. This has contributed to improving recruitment efficiency, increasing customer satisfaction, and providing a smoother and more reliable user experience.

✓ [Senaai](#)

The Senaei platform has successfully leveraged artificial intelligence technologies to support the investor journey by automating application processing and providing intelligent preliminary decisions. In addition, it has developed a specialized Digital Experience Platform (DXP) powered by AI tools that analyze investor data, behavior, and activities from various sources. This enables the digital experience team to better understand investor behavior and significantly enhance beneficiary satisfaction.

Large Action Models (LAMs) to transform the delivery of digital government services

Generative AI, especially through large language models (LLMs), has unlocked new possibilities, making AI more flexible and capable of tackling a wider variety of tasks. To push AI further, Advanced AI Agents—known as Large Action Models (LAMs)—were developed that not only generate content but also perform complex tasks, enabling AI systems to act autonomously in both digital and real-world environments. The Digital Government Authority published a study “[Artificial Intelligence Agents & Large Action Models in Digital Government](#)” that explores cutting-edge Advanced AI Agents, specifically Large Action Models (LAMs), and their potential to transform the delivery of digital government services in Saudi Arabia.
